**COURSE LEVEL ASSESSMENT QUESTIONS****COURSE OUTCOME 1: (Blooms Category: Apply) (Problem Source: Code chef)****Problem Statement:**

Pooja would like to withdraw X \$US from an ATM. The cash machine will only accept the transaction if X is a multiple of 5, and Pooja's account balance has enough cash to perform the withdrawal transaction (including bank charges). For each successful withdrawal the bank charges 0.50 \$US dollars. Calculate Pooja's account balance after an attempted transaction.

Input Constraints:

Positive integer  $0 < X \leq 2000$  - the amount of cash which Pooja wishes to withdraw.

Nonnegative number  $0 \leq Y \leq 2000$  with two digits of precision -To represent Pooja's initial account balance.

Output Constraints:

Output the account balance after the attempted transaction, given as a number with two digits of precision. If there is not enough money in the account to complete the transaction, output the current bank balance.

Example:

TYPE	INPUT	OUTPUT
Successful Transaction	30 120.00	89.50
Incorrect Withdrawal Amount (not multiple of 5)	42 120.00	120.00
Insufficient funds	300 120.00	120.00

**COURSE OUTCOME 2: (Blooms Category: Apply) (Problem Source: Code chef)****Problem Statement:**

Write a program that takes in a letter class ID of a ship and display the equivalent string class description of the given ID. Use the table below.

Class ID	Ship Class
B or b	Battle Ship
C or c	Cruiser
D or d	Destroyer
F or f	Frigate

**Input Constraints:**

The first line contains an integer T, the total number of test cases. Then T lines follow, each line contains a character.  $1 \leq T \leq 1000$

**Output Constraints:**

For each test case, display the Ship Class depending on ID, in a new line.

Example:

INPUT	OUTPUT
3	Battleship
B	Cruiser
C	Destroyer
D	

**COURSE OUTCOME 3: (Blooms Category: Apply) (Problem Source: Hacker rank)****Problem Statement:**

Functions are a bunch of statements grouped together. A function is provided with zero or more arguments, and it executes the statements on it. Based on the return type, it either returns nothing (void) or something. For example, a function to read four variables and return the sum of them can be written as

```
int sum_of_four(int a, int b, int c, int d) {
    int sum = 0;
        sum += a;
        sum += b;
        sum += c;
        sum += d;
    return sum;
}
```

`+=` : Add and assignment operator. It adds the right operand to the left operand and assigns the result to the left operand. So `a += b` is equivalent to `a = a + b`;

**Task**

Write a function `int max_of_four(int a, int b, int c, int d)` which reads four arguments and returns the greatest of them. Note that it is not built in `max` function in C. Code that will be reused is often put in a separate function that returns the greater of the two values.

**Input Constraints:**

Input will contain four integers( one on each line)

**Output Constraints:**

Print the greatest of the four integers.

Sample Input: 3      4      6      5

Sample Output:      6

**COURSE OUTCOME 4: (Blooms Category: Apply) (Problem Source: Hacker rank)****Problem Statement:**

You are transporting some boxes through a tunnel, where each box is a parallelepiped, and is characterized by its length, width and height. The height of the tunnel feet and the width can be assumed to be infinite. A box can be carried through the tunnel only if its height is strictly less than the tunnel's height. Find the volume of each box that can be successfully transported to the other end of the tunnel. Note: Boxes cannot be rotated.

**Input Constraints:**

The first line contains a single integer, denoting the number of boxes. Lines follow with three integers on each separated by single spaces, and which are length, width and height in feet of the box.

**Output Constraints:**

For every box which has a height lesser than 41 feet, print its volume in a separate line.

**Preamble**

A network refers to any interconnected set of objects. An “electrical network” is an interconnection of electrical elements (Active and Passive) such as resistors, inductors, capacitors, transformers, diodes, sources, controlled sources and switches. Passive networks have interconnection of elements which cannot generate energy but can dissipate or stored energy. All electrical and electronic devices can be represented by electric circuits. So formulation of equivalent circuit and the study of behaviour of the network is formulated by analyzing the equivalent circuit with network laws and theorem.

It deals with a discussion on how electron energy bands are formed in semiconductors; followed by discussions on equilibrium statistics of electrons and holes, drift, diffusion currents, and generation and recombination processes. It then examines the principles and operations of essential semiconductor devices used in today's electronics: diodes, light detectors and emitters, bipolar junction transistors and MOSFETs. It includes analysis of small signal model and large signal model of the devices which is the prerequisite for next level courses. The goal is to develop a solid understanding of the device concepts that will be needed in a broad range of areas from semiconductor to circuit (analog, digital and VLSI) design and engineering.
